Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Control of the Sequence action replaced gi:6425549.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens

corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em., EMED. Sw., SMISSPROT, Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP database can be found at which sanger ac.uk/Polets/Celegans/wormpep This sequence chromosome 20 was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 happing Group. Further information can be found at hittp://www.sanger.ac.uk/HGP/Chr20

INFORTANT: This sequence is not the entire insert of clone RP3-4604B If may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true right end of clone RP3-4604B is at 66741 in this sequence. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1:e., phred quality = 30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one M13 subclone, and the assembly was confirmed by the group of Pieter de Jong. It currently consists of 37 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Center code: WIBR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Laborative dil-oct-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Daylor Plaza, Houston, TX 77030, USA
On Oct 11, 2002 this sequence version replaced gi:21988900.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ms to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist enricely of whole genome shotgun sequence reads Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTE: Batimated insert size may differ from sequence length (see thtp://www.hgsc.bem.tmc.edu/docs/Genbank draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

```

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Once and Region of Sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consenues splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are amotated as similar.

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones.

Submitted (15.9AR-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Jul 30, 2002 Like sequence version replaced gi:21954832. INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email

Submitted (19-NOV-2002) Human Genetics, Baylor College of Medicine, One Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 19, 2002 this sequence version replaced gi:23101542.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contigs scaffold'). Within each contig described in the feature contigs are ordered and oriented, and separated by sized gaps filled with Ms to the estimated size. The sequence contigs within a contig-geaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature

NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       261492 bp DNA linear HTG 10-MAY-2003 Status norvegicus clone CH230-114A11, *** SEQUENCING IN PROGRESS AC095338

Submitted (10-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 10, 2003 this sequence version replaced gi:23096505.

The Sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Bach contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome

NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assembly program: Atlas 3.0;

                                                                                                                                                                                                                                                                                                * NOTE: This record contains 84 individual
sequencing reads that have not been assembled into
contigg. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.

Cambridgesper.ac.uk Clone requests: clonerequests.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

ya small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality >=

30); an attempt was made to resolve all sequencing problems, such

one plasmid subclone or more than one MIS subclone; and the

assembly was confirmed by restriction digest. The following

abbreviations are used to associate primary accession numbers given

in the feature table with their source databases: Em.; EMBL; Sw.;

SWISSPROT; Tr:, TREMBL; Wp:, WORNPEP; Information on the WORNPEP

database can be found at

http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence

was generated from part of bacterial clone contrigs of human

chromosome 10, constructed by the Sanger Centre Chromosome 10

Mapping Group. Further information can be found at

http://www.sanger.ac.uk/HGP/Chr10

RP11:55CS is from the library RPC11:1 constructed by the group of

pieter de Jong. For further details see

WPI; 2002-280937/32.

New polypeptides for treating or preventing a disorder associated with them, in humans, e.g. cardiomyopathy, atherosclerosis or cancers.

Example 2; Page 234; 263pp; English.

The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX, a NOVX variant (differing by no more than 15%), the nucleotide

```
encoding NOVX (or its complement, fragment or variant). NOVX is NOV1-14, 154, 155, 164, and 16b. The NOVX polypeptide, nucleic acid encoding it and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NOVX-associated disorder in humans, e.g. cardiomyopathy, atheroselevois, a disorder related to cell signal processing and antibolic pathway modulation, diabetes or cancers. The NOVX polypeptide and nucleic acids are also useful for determining the presence of predisposition to the diseases. The NOVX nucleic acid and polypeptide are specially useful in therapeutic or prophylactic applications for disorders associated with aberrant NOVX expression or activity, e.g. cancers (e.g. diencarcinoma, lymphoma, prostate cancer or uterus cancers (e.g. daenocarcinoma, lymphoma, prostate cancer or uterus immunodeficiency syndrome (AIDS), asthma, Crohn's disease, hypertension, congenital heart defectes, multiple sclerosis, inflammation or Albright hereditary osteodystrophy and many other diseases listed in the conditions. This is also useful in detection assays, chromosome manning the privary osteodystrophy and disease, in disease, and and also useful in detection assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chromosome mapping, tissue typing, diagnostic or prognostic assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present sequence is a reverse transcriptuse (RT)-PCR probe used to measure tissue specific expression of mRNA encoding a NoVX protein

                                                                                  The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63631-ABP64681 and ABO98194-ABQ99267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilital vein endothelial cells (HUVEC) and are expressed in potential to develop atherosclerotic plaques. The ORFX polypeptides and protential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood cardiovascular disease, inflammatory disorders. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPPO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed
                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuleoride sequences have applications in polypeptide and polymuleoride sequences have applications in adjappostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and anino acid sequences. Ab564197-Ab594564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this parent did not appear in the princed specification, but was obtained in electronic format directly from WIPO at electronic format directly from WIPO at electronic format directly from WIPO at the will be princed and produces and performed and performed the constant of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide designated ORFX are present in human atherogenic cells and are useful to prevent and treat ORFX-associated disorders including cancer, allergy, wound healing or autoimmune, cardiovascular or inflammatory disease.

```

The present invention relates to novel human ORFX polypeptides and their

```
were discovered in human atherogenic cells, in particular in platelets and human umbilical vein endothelial cells (HVPC) and are expressed in many other tissues as well. Atherogenic cells are cells which have the potential to develop atherosclerctic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX-associated disorder, e.g. cancer, cardiovascular disease, allergy, autoimmune disease, wound healing, blood for this pater (form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; gene; ss; NOVX; gene therapy; cardiomyopathy; atherosclerosis; call signal processing disorder; metabolic pathway modulation disorder; diabetes; cancer; adenocarcinoma; lymphoma; prostate cancer; uterus cancer; immune response; graft-versus-host disease; acquired immunodeficiency syndrome; AlDS; asthma; Crohn's disease; hypertension; congenital heart defects; multiple sclerosis; inflammation; Albright hereditary osteodystrophy.
coding sequences (ABP63631-ABP64681 and ABQ98194-ABQ99267). The sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated polypeptide (NOVX) a mature form of NOVX, a NOVX variant (differing by no more than 15%). the nucleotide encoding NOVX (or its complement, fragment or variant). NOVX is NOVX-14, 15a, 15b, 16a, and 16b. The NOVX polypeptide, nucleic acid encoding it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptides for treating or preventing a disorder associated with them, in humans, e.g. cardiomyopathy, atherosolerosis or cancers.

and antibody against it, are useful for treating or preventing (e.g. by gene therapy) a NOVX-associated disorder in humans, e.g. cardlomyopathy, a theroscierosis, a disorder related to call signal processing and metabolic pathway modulation, diabetes or cancers. The NOVX polypeptide or predisposition to the diseases. The NOVX mucleic acid and polypeptide are specially useful in therapeutic or prophylactic applications for disorders associated with aberrant NOVX expression or activity, e.g. cancers (e.g. adenocarcinoma, lymphoma, prostate cancer or uterus cancers), immune response, graft-versus-host disease, hypertension, immunodeficiency syndrome (AlDS), asthma. Crohn's disease, hypertension, hereditary osteodystrophy and many other diseases listed in the hereditation. The DNA encoding the protein is useful in gene therapy for treating the conditions. Phils is also useful in detection assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     chromosome mapping, tissue typing, diagnostic or prognostic assays, or for developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. The present sequence encodes a NOVX protein

Novel substantially purified human SH2/SH3-domain-containing adapter polypeptide, termed Src-Like Adapter Protein-2, useful for therapeutic

```
The invention relates to a substantially purified human SH2/SH3-domain-containing adapter Polypeptide, termed Src-Like Adapter Protein-2 (SLAP-CC 2). The invention is useful for treating an immune disorder: involving the invention is useful for Streening for antagonists or inhibitors of the interaction of NSLAP-2 with cellular signalling compounds, for diagnosing, treating or preventing diseases or disorders associated with aberrant or uncontrolled completely which associate with hSLAP-2 and which provide critical signals for cell activation, and as effectors in methods to affect T-cell for cell activation, and as effectors in methods to affect T-cell continue to treat autoimmune diseases which may be caused by the preactivated T cells, in addition to other immune system related conditions, diseases, or disorders, T-cell and B-cell neoplasms, or conditions, diseases, or disorders, T-cell and B-cell neoplasms, or percentive collits, as well as to other immune system related conditions, diseases, or disorders, T-cell and B-cell neoplasms, or percentive collits, rhinitis, inflammatory bowel disease (Crohn's and ulcerative collits), allergies, particularly those involving correctivity or B-cells and T-cells, particularly those involving mast cells or eosinophils, autoimmune diseases such as systemic lupus correctivity or expirationy diseases sincluding confinement or expirationy diseases such as systemic lupus confinement or elegants syndicme, and chronic obstructive or minmonary diseases including and multiple sclerosis, particularly these provisions or minmonary diseases including and multiples sclerosis, particularly man defined the confinement or expiration or expiration and multiples sclerosis, particularly minmonary diseases including and multiples acclerosis, particularly minmonary diseases including and multiples acclerosis, particularly minmonary diseases including and multiples acclerosis, particularly minmonary diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

```
The present sequence is a coding sequence for a novel human abrogen, designated hATF-kringle, comprising the human urokinase plasminogen activator kringle domain. Abrogens such as hATF-kringle are potent inhibitors of endothelial proliferation and angiogenesis. Abrogen polypeptides are capable of inhibiting or reducing cell proliferation induced by both basic fibroblast growth factor (FGF) and vascular endothelial growth factor in a specific endothelial cell proliferation assay, angiostatin only inhibits bFGR induced proliferation in this assay, vectors that expressed abrogen polypeptides in vivo were shown to reduce tumour metastasis in 2 lung cancer models. The invention provides abrogen polypeptides and polymucleotides, and methods of using these to the that an angiogenesis-related disease or disorder, e.g. tumour metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is a coding sequence for a novel human abrogen, designated hATF-kringle, comprising the human urokinase plasminogen activator kringle domain. Abrogens such as hATF-kringle are potent inhibitors of endothelial proliferation and angiogenesis. Abrogen polypeptides are capable of inhibiting or reducing cell proliferation induced by both basic fibroblast growth factor (bfgp) and vascular endothelial growth factor in a specific endothelial cell proliferation assay, angiostatin only inhibits bfgF induced proliferation in this assay, wetcors that expressed abrogen polypeptides in vivo were shown to reduce tumour metastasis in 2 lung cancer models. The invention provides abrogen polypeptides and methods of using these to the an angiogenesis-related disease or disorder, e.g. tumour metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New abrogen polypeptide, useful for treating an angiogenesis related diseases e.g. tumor metastasis.
             useful for treating an angiogenesis related

The present sequence is a coding sequence for a novel murine abrogen, designated hATF-kringle, comprising the mouse urokinase plasminogen activator kringle domain. Abrogens such as mATF-kringle are potent inhibitors of endothelial proliferation and angiogenesis. Abrogen polypeptides are capable of inhibiting or reducing cell proliferation induced by both basic fibroblast growth factor (FGF) and vascular endothelial growth factor in a specific endothelial control in this assay; angiostatin only inhibits bFGF induced proliferation in this assay; angiostatin only inhibits bFGF induced proliferation in this assay; accors that expressed abrogen polypeptides in vivo were shown to abrogen polypeptides and polymention provides freed tumour metastasis in 2 lung cancer models. The invention provides threat an angiogenesis-related disease or disorder, e.g. tumour metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, abrogen, kringle, hATF-kringle, angiogenesis, inhibitor, urokinase plasminogen activator, tumour, metastasis, cytostatic, gene therapy, gene; ss.

The present sequence is a coding sequence for a novel human abrogen, designated hATF-kringle, comprising the human urokinase plasminogen activator kringle domain. Abrogens such as hATF-kringle are potent inhibitors of endothelial proliferation and angiogenesis. Abrogen

polypoptides are capable of inhibiting or reducing cell proliferation induced by both basic fibroblast growth factor (bFGF) and vascular endothelial growth factor in a specific endothelial cell proliferation assay, vectors that expressed abrogen polypeptides in vivo were shown to reduce tumour metastasis in 2 lung cancer models. The invention provides abrogen polypeptides and polymorphotogen polypeptides and polymorphotogen polypeptides and polymorphotogen.

Human, urokinase-type plasminogen activator, uPA, therapy, hypertension, stroke, hypotension, atherosclerosis, heart attack, thrombotic disorder, stroke, hypotension, angiogenic disorder; pulmonary fibrosis, asthmatumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder; respiratory disease; adult respiratory distress syndrome, male impotence; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and anglogenic activity of a mammalian muscle, endchelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular
occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogensis, tumour cell metastassis, qlaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (uPA) kringle DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /product= "Human uPA kringle and connecting peptide" /note= "CDS does not include start and stop codon"
                                                                                                                                                                                                                                                                                              0; Gaps

Site-directed mutagenesis creates two unique restriction sites, the first is recognised by SacI and the second by NdeI. The mutant sequence is inserted into an expression vector system for expression in eg E.coli. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atheroscierosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic
diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthmá, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human urckinase-type plasminogen activator (uPA) amino terminal fragment (ATF) DNA
                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human uPA amino terminal fragment (ATF) and connecting peptide DNA.

The invention relates to a composition comprising one or more domains of uckinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endotherial cell or tissue. The composition is used for treating stroke, hyptotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell metastasis, glaucoma,

Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator.

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oilgonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EST 16-OCT-2001
